

Screenshot 1 : HCI Focus

- ① Viewport toggle — a segmented control lets users switch view modes in one click, with the active option clearly highlighted in blue.
- ② Material channel list — labeled, clickable properties (Base Color, Emission, etc.) let users isolate what they inspect, avoiding a cluttered single view.
- ③ Navigation / Textures panel — shows current settings in plain language and lets users change them directly, with no hidden menus.

Screenshot 2 : CG Focus (Rendered vs. Wireframe View)

Final Render

Wireframe View

- ① Emissive material — the crystal structure glows on its own (self-illumination) rather than reflecting an external light source.
- ② Depth & atmospheric perspective — the distant boat fading into darkness creates a strong sense of scale and distance in the cave.
- ③ Mesh geometry (wireframe) — switching to wireframe reveals the dense triangulated mesh underneath the smooth, lit surface.

Reflection Questions

1. How does the CG quality help or hinder interaction?

The glowing effect and the particle system make this place seem really cool and immersive and helps the eyes see the depth of things to allow natural navigation. However, the same effect also makes it difficult for us to know what is interactive and what is not, because sometimes the dense particles block our views of the objects.

2. One HCI change to improve the interface?

Create some sort of visual cue that indicates which items can be clicked on whenever the cursor is nearby.
